

New Equipment  
Additions 2012  
SMT 3.0" Diameter CNC Mandrel Bender

**Manufacturer of precision tubular parts and assemblies**

Already a leader in CNC and automated bending of small diameter tubing, Custom Tube Products has ordered a new CNC mandrel bender to expand medium & high-volume bending capability to 3.00" diameter. This state-of-the art machine has a triple-stack bend head allowing for up to 3 different bend radii per part, servo-controlled pressure die assist, servo-boosted carriage for tight radius bending, and the latest in computer controls. The bender will be installed in April and will be used to expand production capability for parts such as intake, exhaust, compressor, fuel system, and structural components.

"Although we have had the capability to bend tubing up to 3.00" diameter for many years, we have not been able to cost-effectively produce parts with complex geometry in this size range for medium-to-high volume applications. The addition of this machine will allow us to close this capability gap and provide better options for customers that currently only rely on us for small diameter tube fabrications." states company President David Love.
